

1 Connect the agent for our SHAW example

Example: run the official SHAW 3.03 Trial, then open its soil-profile plot. These three pages take you through **connect AI** → **set up SHAW** → **approve, run and check**. Use GeoForge Desktop 0.6.55 on Windows.

Connect DeepSeek

1. Open **Settings** → **AI services**. Find **DeepSeek (API)** and click **Get a key** to create a key in your own provider account.
2. Return to GeoForge, paste the key into **Paste API key**, select **Use by default**, then click **Save**.
3. Click **Test AI & GitHub**. Continue when the **AI** connection test passes. If it fails, read the error and check your provider account or **Network & proxy**.

DeepSeek in Settings → AI services: the saved key is masked and Use by default is selected. Never share the key.

Create the example project

4. Close Settings. Click + **New chat**, name it `SHAW official Trial`, choose a project parent folder such as `D:\GeoForge\projects`, then click **Create chat**.
5. Before sending a message, select **API** → **DeepSeek (API)** → **deepseek-chat** in the chat header.
6. Click **Auto KI**, search `SHAW`, select it and click **Apply**. Continue to page 2.

Expected result: the AI test passes and the new chat uses DeepSeek and SHAW. This example needs no GeoForge Database token. Keep all credentials in Settings.

Already use a local CLI? Connect it through **Recheck local CLIs**, then choose **Local** before the first message. This worked example uses DeepSeek API; see the full manual for CLI setup.

2 Set up SHAW and its five inputs

Goal: install the real scientific program. The SHAW KI supplies instructions and tools; selecting it does not install the model.

Install and verify SHAW

1. Open **KI Library**, search `SHAW`, click its search result, select **DeepSeek (API)** and click **Set up with agent**. If already verified, choose **Open setup & verification**.
2. On **Agent setup**, choose **Install or build a new copy**. Use a writable folder such as `D:\GeoForge\models\SHAW`; click **Use location** after changing it.
3. Select `deepseek-chat`, click **Start agent setup**, and respond to any **Needs you** request. Wait for GeoForge's final verification. If it fails, read **Verification** and choose **Continue repair**.

AI

Setup agent

Install or build a new copy

Agent prepares software in a GeoForge model workspace.

Use software already installed

Verify an existing executable or installation without replacing it.

Model installation workspace

D:\GFSTest1001\SHAW

Choose folder

Use location

Custom location

Recorded in D:\GFSTest1001\SHAW\kiss.toml and this local KI's .geoforge-install.json.

DeepSeek (API)

deepseek-chat

Re-check with agent

Use KI in chat

An existing installation shows *Re-check with agent*. Setup may need help resolving missing dependencies.

Download and attach the official inputs

4. Download the USDA-ARS [official Shaw303.zip](#). Extract these **five files from Shaw303/**, preserving their names and contents:

File	Contains
Trial.303.inp	Run controls
Trial.30.sit	Site and soil parameters
Trial.30.wea	Weather forcing
Trial.moi / Trial.tem	Initial moisture / temperature

5. Return to `SHAW official Trial`. Click **+ Files** and attach all five files. If a planning card requests them, use its **Upload files** row to bind them to the plan.

Expected result: verification passed; five original inputs attached. Do not use `Output/Trial/` reference results as inputs.

3 Run the example and inspect outputs

This is a real SHAW forward example, not calibration against field observations.

Send this request with the five files

Run the official SHAW 3.03 Trial using my five uploaded files. Preserve all scientific inputs and control flags. Run native SHAW through its KI: raw files in `outputs/SHAW/trial/`, CSVs in `outputs/SHAW/csv/`, soil-profile plot at `outputs/SHAW/shaw_profiles.png`. No Database, generated forcing or calibration. Check raw rows: temperature/moisture 301 each, liquid 14, energy 300, water 13, frost 48; all end at 1986-12-17 00:00.

Review and start

1. Answer the planning cards. On **Approve the plan?**, check SHAW, five inputs, output locations and **run** → **parse** → **plot**.
2. Choose **Modify the plan** if needed. Otherwise select **Approve and start**, then **Continue with this choice**.
3. Keep GeoForge running. Open ◇ **Project status**; wait for **Project complete** and passing records for all three steps.

The real completed Trial project, as reported by GeoForge.

Open the files

4. Click ☒ **Folder**. Open `outputs/SHAW/csv/` and the generated `shaw_profiles.png`. Check the dates, row counts and 11 soil nodes.

Temperature CSV preview from the verified Trial. This guide preview uses actual data; the app's full plot has five panels.

If incomplete: ask the agent to diagnose and rerun the named failed step. An AI success message alone does not prove completion.
